

JLT Forkbeard™

Bluetooth Pairing and Wedge Application for Quick and Easy Scanner Setup with JLT Computers

Smoother Bluetooth Pairing with JLT Forkbeard™

Software that enables quick and easy setup of industrial Bluetooth scanners with computers from JLT Mobile Computers.

Industrial scanners normally use a Bluetooth profile called Serial Port Profile (SPP) mode for data transmission. This mode of operation makes a scanner compatible with applications that gather scan data via a serial port. However, since there is no standard procedure for quick connect and disconnect, managing multiple scanners in SPP mode can be cumbersome and time consuming as it must be done manually each time, by the operator on the connected computer.

With JLT Forkbeard, this pairing issue is no longer a problem. By installing this software on your JLT computer, the built-in Bluetooth chip and aerial enables pairing with a scanner, so setup goes much faster – simply scan the barcode to connect or disconnect!

Time Saving

JLT Forkbeard enables the operator to quickly connect, disconnect or change scanners during a workday. The minimalized interaction with a host computer makes this process much faster.

Easy to Use

When JLT Forkbeard software is installed on a computer, two separate barcodes will be available: one for connecting devices and one for disconnecting. To connect a new scanner or disconnect a paired one, the operator simply scans the appropriate barcode. No need for manual connection!

Compatibility

Developed for Windows 10, JLT Forkbeard is available for all Windows operating JLT devices and is compatible with almost every scanner* on the market. Yes, use scanners from different manufacturers on the same JLT computer! Even if you have scanners from several brands in your operations, your workforce can easily change between them during their shift.

Process Data with Integrated Keyboard

A keyboard wedge with suffix support is also integrated with the software, enabling serial data to be processed as keyboard input with the option of suffix.

*JLT Forkbeard software can be used with scanners from vendors such as Honeywell, Zebra, Symbol, Motorola and Data Logic on most models. New models are not guaranteed but JLT continuously optimizes its software wherever possible. For some models you may need to use the vendors own software to create pairing barcodes for your units.
